

Seal Rock Water District

is developing a New Water Supply for you

How much do you know about your drinking water?

If you're like most of us, only a little. Thankfully, we have grown accustomed to obtaining safe drinking water from our faucets day after day, without having to give it a second thought.

Seal Rock Water District is making changes to keep that true.

An illustration of the planned treatment facility for Seal Rock Water District.

The District's water is currently supplied by the City of Toledo. Water is withdrawn from the Siletz River, pumped to Toledo where it is treated, then pumped to our system through 10 miles of pipeline. Unfortunately, parts of the system are vulnerable. The 10-mile pipeline has been damaged repeatedly by landslides and could be lost altogether in a large earthquake.

The District recognized the need to replace this system several years ago. A careful review of options led the District to Beaver Creek. Centrally located in the service area, Beaver Creek offered the most reliable supply of water of any nearby source.

The District's planned withdrawal from Beaver Creek represents only a small portion of its flow and will not adversely affect wildlife and riparian habitat.

Following years of discussions with stakeholders and neighboring property owners, and a thorough permitting effort, the District is embarking on construction of its own water supply. Water will be withdrawn from Beaver Creek near the South Beaver Creek Road bridge. It will be pumped to a secure site located above the Makai development, where it will be treated using a modern membrane filtration technology.

We invite you to contact the District office at **541-563-3529** if you have questions or comments. You can also visit us online at srwd.org. Thank you.
